

## Rolly Pollys

You've encountered them by lifting a brick or a moist object, you may even have felt disgusted, and even wondered what nature was wanting when creating them.

Well, oniscides, are a suborder of earth isopod crustaceans, whose function in evolution is to eliminate heavy metals like mercury, cadmium and lead, the extremely harmful to humans, contributing to soil and groundwater cleansing. (Don't kill them, don't crush them, pass the word to the kids!!!)
